## **Acknowledgements**

The Hamilton Township (Mercer County) Stormwater Outfall Assessment has been produced by the **Rutgers Cooperative Extension (RCE) Water Resources Program**.

Funding for this project was generously provided by the **Township of Hamilton, Mercer County, New Jersey** and in part by the **New Jersey Agricultural Experiment Station** through the United States Department of Agriculture.

## **Introduction**

Hamilton Township, located in Mercer County, New Jersey, owns and operates over 300 stormwater outfalls that drain directly into waterways. This is a summary of the outfall pipe inspection program conducted in 2023. The purpose of the program is to provide an assessment of existing conditions related to stream scouring at stormwater outfall discharge locations in streams and waterways as well as identify potential illicit discharge connections. This assessment evaluates the overall integrity of the outfall structures, erosion caused by the outfalls, and other factors that may identify potential illicit discharges.

The outfalls assessed were previously inspected in 2015, 2017, and 2019. All outfalls that are “owned and operated” by Hamilton Township per the municipal separate storm sewer system (MS4) permit from the New Jersey Department of Environmental Protection (NJDEP) are required to be inspected once every five years. Moving forward, one of four inspection zones will be inspected each year with the fifth year used to find outfalls missed during initial inspection rounds. Region 2 includes the north branch and central branch of the Pond Run watershed within Hamilton Township.

All efforts for this project were for the purpose of inspecting outfall pipes that discharge directly to mapped streams. It was not the intent of this program to be a complete and comprehensive inventory of all stormwater pipes in the municipal separate storm sewer system (MS4), but all effort has been made to identify and inspect those discharging near or directly to streams. The assessments were performed from June to July 2023 by the Rutgers Cooperative Extension (RCE) Water Resources Program.

## **Methods and Procedures**

A multi-part approach was taken to assess stormwater outfalls that discharge directly to waterways in Hamilton Township. A geographic information system (GIS) was used to visualize the location of mapped outfall locations using existing data. A data collection layer was created using ArcGIS Pro to digitize the inspection forms provided by NJDEP: “Outfall Inspection Form” and “Illicit Connection Inspection Report Form” for easier data collection. Environmental Systems Research Institute’s (ESRI) Field Maps software was used as this

software allows for data collection using smart phones or tablets in the field even if internet connection is unavailable. This collected data can then be easily synced later to the main dataset without having to compile the data. The software allowed staff to photograph, record data, and update the geolocation of each stormwater outfall assessed. This collected data included information about the properties of the outfall (type, size, material, etc.), needs for maintenance or repair of outfall structures, presence of stream scouring, and the potential of an illicit discharge. This collected data was then processed and standardized as needed for consistency across the dataset.

A total of 104 outfalls were located and assessed following 72 hours of no rainfall\* in 2023. This is out of 377 previously identified outfalls and an additional 34 that were identified and found based on stormwater mapping that were missed during previous inspections. There were 20 outfalls that were not found or inaccessible that were identified in the previous inspection efforts. Of these, five (5) could not be located, and the remaining 15 could not be accessed due to the lower part of Pond Run having a large concrete channel that could not be entered. An additional 15 were added that were identified as actual outfalls in the channel, but they could not be properly inspected due to restricted access to the area. There were seven (7) outfalls from previous inspections that were reassessed as not being outfalls (culverts, basin inflow, or other structures) or being duplicate points. This leads to an updated total outfall number of 420 outfalls in Hamilton Township, 139 of which are located in Region 2 (i.e., the north and central branch of the Pond Run watershed).

The outfall ID numbers were also reassigned to align with the stormwater management goals more closely. The previous ID numbers used a grid that is not actively utilized, so an ID that includes the watershed abbreviation was used instead. The outfalls were renumbered with low values upstream and high values downstream. When new outfalls are identified or installed, they will be assigned the next number in the sequence. Outfall IDs will be reassigned each year as each round of inspections is completed to avoid disrupting the numbering scheme in the event outfalls are added or removed.

\*Rainfall data from NJDEP's Rainfall Data Acquisition page for stations RA099, RA101, RA103, and RA107. No rainfall was considered if the average rainfall from these stations was 0.01 inch or less.

A prioritization was developed using the field data collected. Priority was given to outfalls that showed significant signs of deterioration, were causing downstream erosion, were unstable due to erosion, or showed signs of illicit connections. All outfalls were placed on a scale from 1 to 5 with 5 being the highest priority and needing immediate attention. Anything that has been assigned a priority level of 3 or higher should have action taken for maintenance or repair.

## **Summary of Key Findings**

The following conclusions were formed after reviewing data for the 104 outfalls assessed. Out of the 104, a total of three (3) of the assessed outfalls were designated as high priority (4 or 5), 18 were designated as medium priority (3), and 83 were designated as low to no priority (2 or 1). For scouring, two (2) have high, 12 have medium, 10 have low, and 80 have none. Action should be taken for anything at high or medium erosion levels to prevent further erosion, and the low erosion outfalls should be watched for future issues. For maintenance, there were three (3) outfalls in need of significant repair, and 28 in need of maintenance either by clearing out sediment or patching cracking portions.

A total of 11 outfalls were suspected of illicit discharges during the initial investigation. These outfalls will be investigated again during dry weather and sampled where possible to identify if these dry weather flows are potential illicit discharges. The results of the sampling will be summarized in an Illicit Discharge Detection Investigation 2023 report once completed.

Detailed information about each outfall assessed can be found in the Tabular Data section of this document. There are a series of tables highlighting each priority criteria. Summary maps of this information can be found in the Summary Maps section. The data with images of the outfalls can also be viewed using the web map (<https://go.rutgers.edu/c1vpvcv2>). This is presented instead of the individual outfall assessment pages that were provided in previous reports to allow a more interactable version of these pages.

## **Recommendations**

Based on the assessment and summary findings, recommendations are as follows:

1. The three outfalls identified as high priority should be visited by Hamilton Township personnel, and a plan and schedule should be developed to take the necessary corrective actions as soon as possible.
2. A complete maintenance plan and schedule should be developed for all stormwater outfalls in Region 2 to address the deficiencies noted in this assessment in a timely manner starting with those with highest priority.
3. Each year, subsequent Regions should be inspected (Region 3 in 2024, Region 4 in 2025).
4. In the fifth year (2026), effort should be made to inspect outfalls which were not found during the initial round of inspections.

This assessment was not intended to be a complete and comprehensive inventory of all stormwater outfalls in the MS4 system. Efforts for this project focused solely on mapping and inventorying known outfall pipes discharging directly to mapped streams. Other outfalls in the municipal separate storm sewer system (MS4) likely exist and should be identified and added to the database as found.

## Suspected Illicit Discharge

Outfall_ID	Color	Turbidity	Floatables	Deposits or Stains	Adjacent Vegetation (compared to other areas)	Notes	Overall Priority
PN010	Clear	Clear	None	Excessive sediments	normal	cracking underneath outfall	3 - Medium
PN012	Clear	Clear	Other	None	normal	Welts of grass	2 - Low
PN014	Clear	Clear	None	Other	normal	cracks and minor erosion	3 - Medium
PN016	Clear	Cloudy	Petroleum	None	normal	Partially submerged pipe, very slow moving water bordering on stagnant.	3 - Medium
PN019	Clear	Clear	None	Excessive sediments	normal	the discharge is orange-brown (looks to be iron deposits or algal growth), Other outfalls under bridge are strangely blocked with concrete/boards so no longer serve as outfalls	2 - Low
PN023	Brown	Cloudy	None	Other	normal	the discharge is an orange-brown color and also floating on top of water	2 - Low
PN029	Brown	Clear	None	None	normal	Backed up with sediment debris	3 - Medium
PN037	Clear	Clear	None	No Illicit Discharge	normal	<Null>	2 - Low
PN074	Clear	Clear	None	None	normal	Good, just flowing during dry weather	2 - Low
PN121	Clear	Clear	None	None	normal	Fenced off, has dry weather flow , estimated measurement 36"	3 - Medium
PN127	Clear	Clear	None	None	normal	pond that serves as retention basin at grounds for sculpture draining to outfall	3 - Medium
PN004	<Null>	<Null>	Suds	None	normal	Deep pool of standing water adjacent outfall from erosion	3 - Medium
PN130	<Null>	<Null>	<Null>	White crystalline	normal	white/grey staining	2 - Low

## Outfalls Removed from Database

OLD_ID *	Subwatershed	Is the discharge coming directly from a pipe?	Pipe Diameter [in] (if applicable)	Pipe Material	Notes	Year Assessed Previous
D0308	Pond Run	Y	18	Concrete	outfall blocked by bricks, no longer serves as outfall	2015
D0309	Pond Run	Y	18	Concrete	outfall is blocked off by bricks, no longer serves as an outfall	2015
D0310	Pond Run	<Null>	18	Concrete	concrete channel to a detention basin at location, real location is under bridge-- otherwise no outfall was found, original point part of bridge cluster, real	2015
D0313	Pond Run	Y	18	Concrete	Pipe is blocked off by bricks and no longer serves as an outfall	2015
D0312	Pond Run	Y	36	Concrete	outfall flow is obstructed by bricks, no longer serves to conduct flow	2015
D0314	Pond Run	Y	36	Concrete	Pipe is blocked off by bricks and no longer serves as an outfall	2015
C0303	Pond Run	<Null>	36	Concrete	Culvert, not an outfall	2015
